

XSML Capital joins the Joint Impact Model

XSML Capital has become a member of the [Joint Impact Model](#) (JIM) that provides a harmonized and transparent methodology for financial intermediaries to measure the indirect impact and climate risks of their investment portfolios in emerging markets.

Our partnership with the JIM will help us to better understand the impact of our portfolio companies and comply with industry standards.

The JIM toolkit will further strengthen our management system in quantifying our impact. The model will measure our portfolio's greenhouse gas emissions, economic value added, and indirect employment generation (jobs supported).

The model aligns with best-practice methodologies, such as PCAF for measuring greenhouse gas emissions, and utilises up-to-date macro and micro-economic statistics.

The JIM, a non-for-profit organization, was launched 3.5 years ago by several Development Finance Institutions with the support of consultancy Steward Redqueen to provide a methodology to measure and report on the indirect impacts of investments and address the challenge of a lack of climate and environmental data.
